

Gender and Political Representation

Session 8: Supply-Side Explanations

Mirko Wegemann

Universität Münster
Institut für Politikwissenschaft

28 May 2025

What we did last week...

Anyone can briefly summarize our last session?

Plan for today

This week, we'll have our final session on the causes of inequalities. We'll focus on women themselves and why they may not run for office.

Back to the first stage

In the last couple of weeks, we have approached the question of the female under-representation in politics already from step 2.

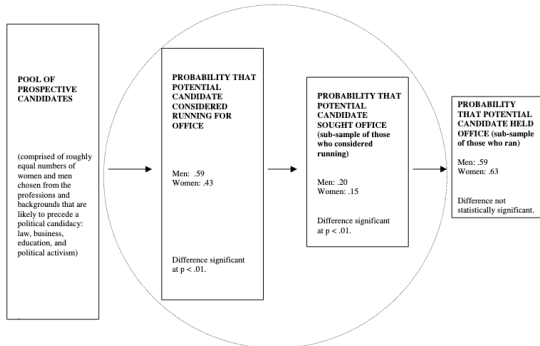

Our assumption was:

- women want to get into politics
- there are various barriers preventing them from becoming elected
 1. institutions (like electoral systems)
 2. parties (and their selection mechanisms)
 3. voters (and their implicit biases)

What if this assumption is wrong?

Back to the first stage

FIGURE 1 Candidate Emergence from the Pool of Prospective Candidates

@Bennett and Celine?

A candidate pool full with men

TABLE 1. Rates of Entry and Number of Potential Candidates across Pools and By Party

Sample: Source: Office sought:	(1) State legislators Thomsen (2017) U.S. House		(2) Named in newspapers King (2017) U.S. Senate		(3) Lawyer-donors Bonica and Sen (2017) State or federal office	
<i>All</i>	Women	Men	Women	Men	Women	Men
Rate of entry (%)	1.4	1.5	48.6**	56.2	0.5**	0.7
Raw number	7,099	23,883	432	2,558	83,819	295,719
Total candidates	101	349	210	1,437	392	2,109
<i>Democrats</i>	Women	Men	Women	Men	Women	Men
Rate of entry (%)	1.2	1.1	50.2	55.2	0.4**	0.6
Raw number	4,646	11,899	243	1,160	67,005	190,520
Total candidates	56	126	122	640	285	1,195
<i>Republicans</i>	Women	Men	Women	Men	Women	Men
Rate of entry (%)	1.8	1.9	46.6**	57.0	0.6**	0.9
Raw number	2,453	11,984	189	1,398	16,814	105,199
Total candidates	45	223	88	797	107	914

Note: ** $p < 0.01$, * $p < 0.05$.

Figure: A male pool of candidates (Thomsen and King 2020)

What could explain the differences in the candidate pool?

A candidate pool full with men

Notes: Data are based on responses from 1,020 men and 1,097 women. Bars represent the percentage of men and women who fall into each category. The gender gap in each comparison is statistically significant at $p < .05$.

Figure: The gender gap in political ambition (Lawless and Fox 2013)

So, do women simply not want to be nominated for office?

A candidate pool full with men

Figure: The prior NZ Prime Minister on Motherhood and Politics [text](#)

A candidate pool full with men

"It's difficult to balance it all. We are fed that myth that you can have it all, as a "Wonder Woman." . . . I found that you can't be the best mom and the best congressperson. You try to strike a balance. But you can't do 100 percent. . . . You keep the balls in the air, and you hope for the best. There is great guilt and angst as to what is the proper way." (Lawless and Fox 2010, p. 72)

Women are still often faced with a double bind.

A candidate pool full with men

Survey on the reading

To Emerge? Breadwinning, Motherhood, and Women's Decisions to Run for Office

Before we start, please form groups, go through the paper once again and try to complete our classification scheme. [10 minutes]

- **Research Question:**
- **Main Argument:**
- **Data and Method:**
- **Results:**
- **Implications:**

Research Question

- **Research Question:** Do structural resources influence women's decision to run for office?
- **Main Argument:**
- **Data and Method:**
- **Results:**
- **Implications:**

Argument

- **Research Question:** Do structural resources influence women's decision to run for office?
- **Main Argument:** Women may consider running but their socio-economic situation prevents them from competing.
- **Data and Method:**
- **Results:**
- **Implications:**

Argument

There are two types of political ambition

1. *nascent ambition*
2. *expressive ambition*

How do they differ? Which role do they play in the argument by Bernhard, Shames, and Teele (2021)?

Argument

- women may consider running but this *nascent ambition* does not translate into the actual behavior
- constraints are based on aspects of the household
 - lack of resources (e.g. gender pay gap)
 - too much responsibility in household (female breadwinner)
 - no one absorbing potential risks of income loss at household

Argument

Bernhard, Shames, and Teele (2021) also argues that carework might play a role. Which one? How can this be integrated into the argument of female breadwinner?

Data and Method

- **Research Question:** Do structural resources influence women's decision to run for office?
- **Main Argument:** Women may consider running but their socio-economic situation prevents them from competing.
- **Data and Method:** Mixed-methods study among alumni of Democratic Party's campaign training unit
- **Results:**
- **Implications:**

Data and Method

What's the main challenge when studying who decides to run for office?

Data and Method

Often, we only have data on those people available who decided to run for office (remember Verge and Astudillo (2019))

- they rely on survey from alumni of 'Emerge America' (EA), a Democratic recruitment programme
- three types of data
 - intake data (n=2,083)
 - screening data
 - alumnae survey (n=702)
 - dependent variable: decision to run for office
 - independent variables: income, breadwinning and household composition

Data and Method

FIGURE 1. Study Group, Sample, and the Dependent Variable—the Decision to Run among Political Novices

Note: The percentages listed refer to the share in each category of total respondents. Overall, the 32% of total respondents that ran after the training represents 39% of all novices.

Figure: Sample characteristics of EA

What are potential problems coming with this data source?

Data and Method

- only Democrats; motivations for Republicans may differ (think about last session)
- participants needed to pay a (substantial) fee of \$1,000 → is participation in EA actually already expressive ambition?
- we are missing another interesting control group, which one?

Findings

- **Research Question:** Do structural resources influence women's decision to run for office?
- **Main Argument:** Women may consider running but their socio-economic situation prevents them from competing.
- **Data and Method:** Mixed-methods study among alumni of Democratic Party's campaign training unit.
- **Results:** Particularly breadwinning reduces women's likelihood to run for office.
- **Implications:**

Findings

FIGURE 2. Deterrent Factors in Candidate Emergence

Note: Coding is of open-ended data from political novices; answers could be coded into multiple categories.

What do Bernhard, Shames, and Teele (2021) ask their respondents? What's the advantage of their approach?

Findings

Which expectations are supported by their evidence?

Findings

How do motherhood and breadwinning relate to each other?

Implications and alternative explanations

Question by Ákos: Should political institutions consider economic compensation or family-friendly reforms for candidates?

Question by Marina: How would this study and the findings shift when confronted with different national contexts such as different social norms, welfare systems and political structures? Do the results conflict with the finding by Fox and Lawless (2004) that women lack political ambition to run for office?

Implications and alternative explanations

- **Research Question:** Do structural resources influence women's decision to run for office?
- **Main Argument:** Women may consider running but their socio-economic situation prevents them from competing.
- **Data and Method:** Mixed-methods study among alumni of Democratic Party's campaign training unit.
- **Results:** Particularly breadwinning reduces women's likelihood to run for office.
- **Implications:** Even if women are ambitious, socio-economic considerations may prevent them from running for office

Other factors

Which other factors may prevent women from running for office?

Other factors

One of the more powerful confounders in the study by Bernhard, Shames, and Teele (2021) was the ‘political environment’

Other factors

Yan and Bernhard (2024) ran a field experiment in which they texted people (liberal organizations' supporters) campaign messages – randomly varying whether the sender was female or male (by name)

TABLE 1. Sample Responses and Response Rates by Category		
Category	Rates	Examples
Offensive	Study 1 = 3.76%	"No. Your fat."
	Study 2 = 6.59%	"fuck off marching won't do shit except waste time."
	Overall = 4.35%	"my name is [NAME] you slut. what kind of stripper name is Jessica anyway."
Silencing	Study 1 = 2.22%	"bitch stfu"
	Study 2 = 12.86%	"STOP TEXTING"
	Overall = 4.44%	"Lose my number lady"
Withdrawals	Study 1 = 27.79%	"No thank you. Please, quit texting"
	Study 2 = 36.46%	"please remove me from these messages"
	Overall = 29.60%	"Stop"

Figure: Example responses (Yan and Bernhard 2024)

In general, female volunteers were more often harassed and people withdrew more often from the mailing list

What we've learned today...

- how the candidate pool is highly skewed towards male candidates
- that there's a difference between 'nascent' and 'expressive' ambition
- that socio-economic differences in the household may held women back from running for office

To prepare for next week...

- next week, we'll start with an evaluation of potential institutional fixes to improve women's representation in politics
